Product Vision

Using the Geoffrey
Moore Template*

FOR a member of an organization or household

WHO needs an application,

OUR Team Organizer, an interactive to-do list

THAT offers a flexible, visual and shareable (in real-time) task planner, where the user can intuitively and freely sort tasks by project, location and category, with the help of labels, tables, cards and folders.

UNLIKE Microsoft to-do or Google Tasks,

OUR PRODUCT has a wide range of display options that the user can choose, allowing a variety of sorting possibilities. It also allows, and is even based on, not just sharing the tasks with other people, but creating workgroups and subdivisions for each project, as well as a hierarchy for the teams.

Project plan : Using Hermes V, Service/product (agile)

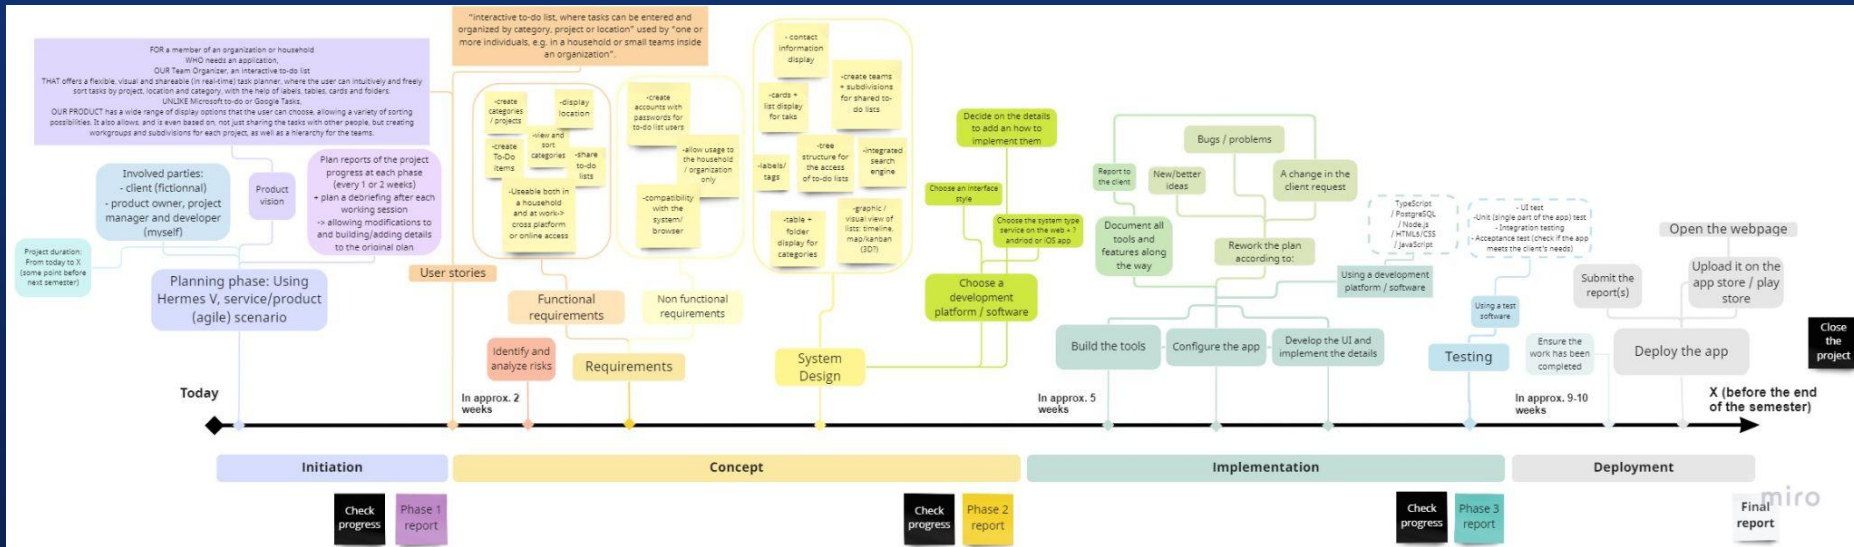

As a reference documentation, I have used the Hermes 5 documentation provided by the Swiss federal administration: <https://www.hermes.admin.ch/en> .

Since the application we want to develop is a **product**, and we need a scenario that **allows agile practices**, I figured out the **Service/product (agile)** scenario would be the most suitable for the project.

This scenario is intended for the agile development of products / services that are designed for the specific needs of a user/client.

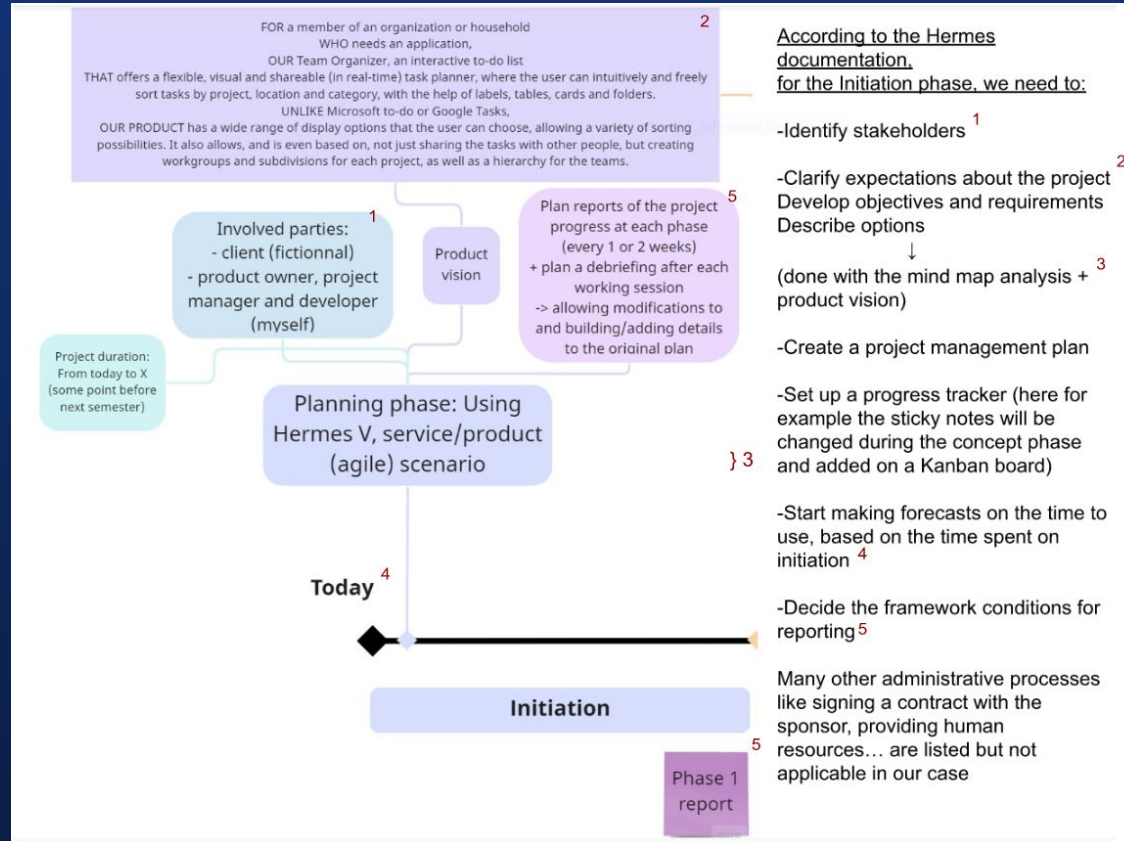

The service/product scenario consists of 4 phases: **Initiation**, **Concept**, **Implementation** and **Deployment**. With Agile methods (Scrum or Kanban), the first two phases are kept minimal and reworked periodically during the Implementation phase if some problems have been discovered or adjustments are needed, and customer feedback is collected as often as possible during the project.

Project Plan: Timeline

Project Plan: Initiation

03

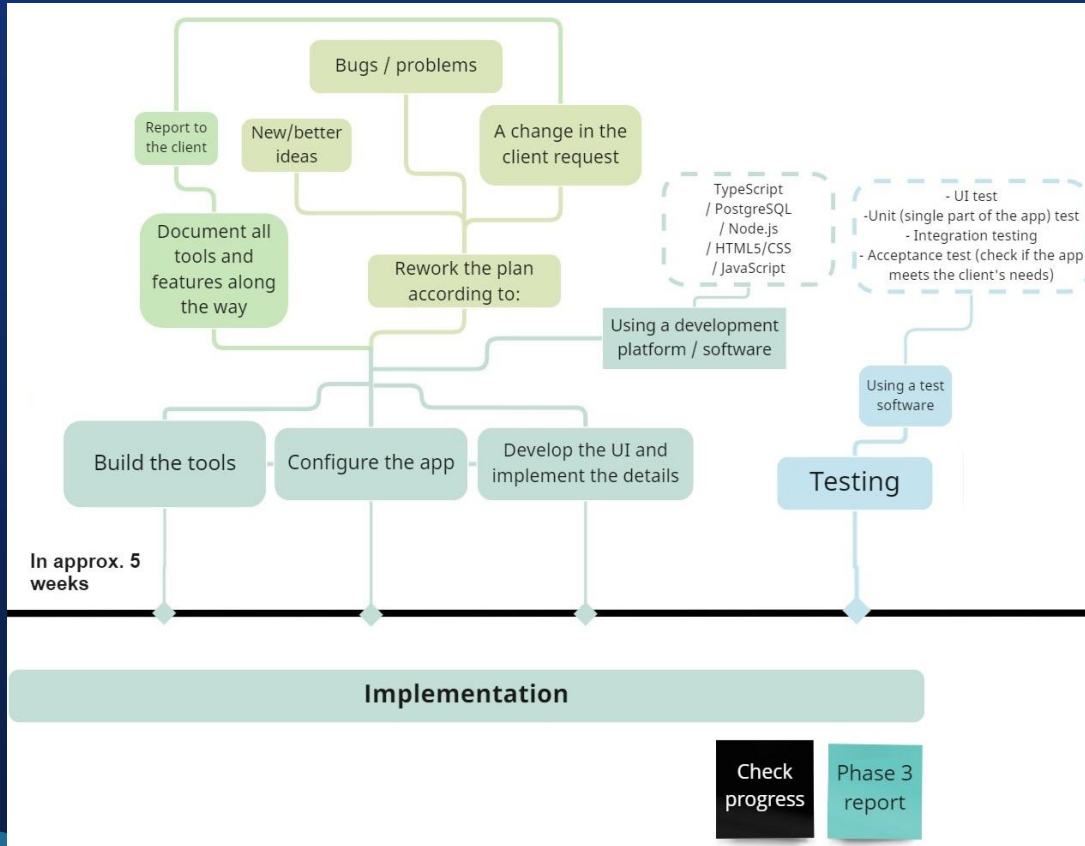

- Add more objectives ¹ / criteria to the project plan (it includes the product concept but also the deployment concept) and continually update it, evaluate its sustainability
- List functional / non-functional requirements for the app ²
- Design the system ³
- Check progress using the project management tool (Github) ⁴
- Find and analyze risks / problems and define a strategy to counter them ⁵
- Take measures / rearrange them ⁶
- Carry out records for the report ⁷

Other processes are listed in the Hermes documentation but not applicable in our case.

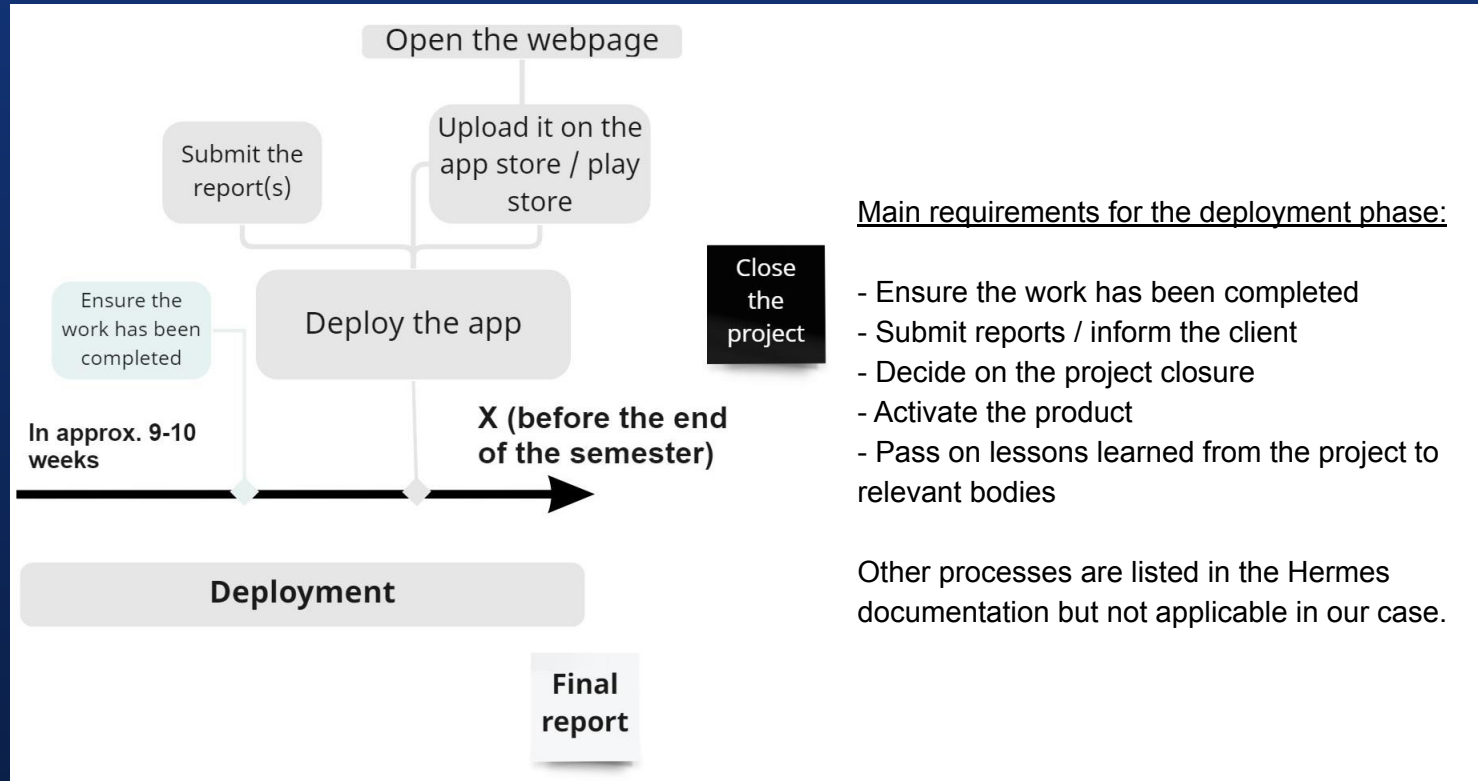

Project Plan: Implementation

05

Requirements for the Implementation phase:

Mainly the same as for the concept phase, but we need to **realize the plan** instead of **designing it**. At the end of the phase, it is required to prepare for deployment via testing and to check if the product meets the customer's needs. But since we are using agile methods, this is supposed to be a continuous process.

THANK YOU

For your attention
